**Email:** info@vetfonds.lv  
**Test type:** Complete  
**Date tested:** 11/08/2021  
**Test number:** xxxxxxxx  
**Customer number:**

### < 200

Scores of less than 200 can be considered as a potential suitable ingredient for an elimination diet. High Negative Predictability: Ø 75% (IgE), Ø 84% (IgG).

### 200-250

Scores in this range are dubious. Can be considered as a potential suitable ingredient for an elimination diet if no scores below 200. Clinical history and previous diets should be extensively evaluated.

### > 250

Scores of 250 or above are unusually high. Should not be considered as a potential suitable ingredient for an elimination diet. Low Positive Predictability: 15-100% (IgE), Ø 35% (IgG).

\* Elisa Absorbance Units. EA indicate the level of allergen-specific IgE and IgG detected. The magnitude of the signal does not necessarily correlate with the severity of the disease, but does reflect the pet's immune response to ingredients.
